

Verum Omnis — UI Build Spec: Desktop Split & Phone Chat (Dual■API • Dual■APK • Offline Forensics)

Overview

- Two pages only: Landing + Chat. Desktop/web chat uses a split layout (left: Case Workspace, right: Legal Chat). Phone app shows chat-only (right panel).
- Mic and Paperclip are inline with the Send bar: Mic = voice input; Paperclip = file attach; no extra forensic buttons.
- Sealing is automatic: the API/engine decides when to seal or when the user types 'seal now'. No separate UI button is required on phone.

Desktop/Web — Split Template (ideal for law enforcement & lawyers)

- Left: Case Workspace — drop files/emails/audio; live list of computed SHA■512 hashes; timeline & notes; case filter.
- Right: Legal Chat — large scrollback, auto-scroll on new tokens; shows provider answers + consensus; displays any seals created by policy.
- Header: Mode badge (Citizen/Institution), licensing notice (institutions pay after trial). Footer: privacy disclaimer.

Phone App — Chat■Only

- Single Chat screen: Text box + Send; inside the row: Mic (voice■to■text) and Paperclip (attach).
- Voice input runs on-device STT if available; otherwise prompts to allow network STT (policy banner).
- Attachments are hashed locally (SHA■512) and listed under the chat; hashes included in any sealed transcript.
- Sealing policy: API decides; user can explicitly say 'seal now' to force a seal. No separate visible seal button.

Dual■API Orchestration (Two Heads)

- Two external AI providers are called via the Functions proxy. Keys never appear in browser/app bundles.
- Consensus policy: If both respond and align → return answer; if they diverge → show both + flag; if one is down → use the available one with degraded banner.
- Timeouts & backoff: 6s soft timeout per provider; exponential backoff; circuit breaker after 3 consecutive failures per provider.
- Escalation: conflicting legal advice triggers 'human review' suggestion and optional seal with reasons.

Dual■APK Packaging (Institution Builds)

- APK■A (Primary) + APK■B (Fallback) are identical UI, but each ships with an independent, signed rulepack & provider preference order.
- Failover: If APK■A cannot reach its first provider for > N minutes, it can switch to APK■B core via shared storage handoff (or administrator selection).
- Both APKs contain Gift Rules v5, contradiction engine, and offline forensics; license activation determines which core is active.

Offline Forensics & Case File

- All hashing/sealing done client■side. A rolling case file (JSONL) is stored locally: each message, action, hash, and decision step is appended.
- When the app opens, it ingests the file to rehydrate context. If offline incidents occurred, they are sealed and queued for optional sync when online.
- Sealed transcripts include: top logo, diagonal watermark, footer block (✓, SHA■512, timestamp), and QR to `verify.html#<hash>`.

API Surface (Functions)

- POST /api/assistant — {prompt, mode} → {parts:{api1,api2}, consensus}. Implements dual■API calls and consensus logic.
- POST /api/notify — {org,site,rule_id,prevented_amount,currency,timestamp,hash_prefix} → emails

Verum Omnis — UI Build Spec: Desktop Split & Phone Chat (Dual-API • Dual-APK • Offline Forensics)

API Surface (Functions)

- POST /api/assistant — {prompt, mode} → {parts:{api1,api2}, consensus}. Implements dual-API calls and consensus logic.
- POST /api/notify — {org,site,rule_id,prevented_amount,currency,timestamp,hash_prefix} → emails documents@verumglobal.foundation (metadata only).
- GET/POST /api/scoreboard — returns/updates per-site counters for events & amounts saved (metadata only).
- Security: helmet + CSP (self + jsdelivr for pdf/lib/qrcode), JSON limit 1 MB, rate limit 100/15m.

Sealing Triggers (automatic)

- Contradiction event detected by B1;
- End-of-session or 'seal now' instruction;
- Incident threshold met (e.g., financial anomaly, metadata gap unresolved, voice spoof);
- Institution policy (e.g., auto-seal on RUNWAY_INC, FIRE_CRITICAL, or POS_FRAUD over threshold).

Minimal UI Spec (exact widgets)

- Chat row: [Mic icon][Paperclip icon][Text input][Send]. Mic opens STT; Paperclip opens file picker.
- Desktop left panel widgets: File drop area, Hash list (copy buttons), Case timeline, Notes, Filter (All/Incidents/Sealed).
- Badges: Mode (citizen/institution), Provider health (API 1/2), Degraded banner if only one head responding.
- Accessibility: high contrast, keyboard focus rings, aria-live polite for tokens, aria-labels on Mic/Paperclip.

Governance & Privacy

- Stateless for citizens; institutions send metadata only. No raw evidence leaves the device unless sealed with explicit policy/human approval.
- Dual-key activation for high-scope modules: public transparency receipt on activation/revocation.
- No telemetry or analytics; only counters when enabled by institution policy.

Delivery & DoD

- Two pages live (Landing + Chat) - split layout on desktop, chat-only on phone; zero console errors.
- Functions proxy deployed; dual-API secrets stored as Functions secrets; email hook validated (metadata only).
- Capacitor wrapper builds (debug) and loads hosted origin; APK-A and APK-B signed with independent rulepacks.

Stateless • Dual-key oversight • Transparency receipts
